

## The Pros Know How to Clean High-Rise Windows

Cleaning the windows of commercial buildings and skyscrapers can be very tricky and dangerous. Any high-rise window cleaning needs the professionals on the case and it may take some time. Aside from the hazards that go hand in hand with high-rise window cleaning, the equipment used can be quite an expensive investment. So it is highly advisable to hire a reliable high-rise cleaning company in your area.

If you need high-rise window cleaning specialists, you'll find that they use some common methods for reaching up high. All of these methods are very risky and hazardous, so that is why most of the cleaners are covered by insurance by their respective companies.

### High Wash/Pole Window Cleaning

Because we're a nation of modern technology fans, the old window cleaning ways of the past have now been made much easier with the use of a telescopic window cleaning pole. With the use of purified water, the window glass and frames are cleaned from the relative safety of the ground. Despite the overall ease of use with telescopic poles, they can become a problem when the high-rise building is situated near trees and lampposts. In some cases, you may even find a building overhang, which makes it very difficult to clean the windows on the high levels.

### Rope Access

There is also another way to clean high-rise buildings, and that is with the use of rope. All window-cleaning jobs have to be assessed whether the use of rope is the most appropriate method to use to get the work done. With any kind of work like this, there carries a danger risk, and so whatever method is chosen, it is important that safety is considered.

In fact, all window cleaners should be trained in the use of rope because it is a very difficult skill to acquire. The cleaner will wear a harness in order to do this type of cleaning.

### Access Platform

Another option is to use hydraulic platforms to reach those windows up high. When cleaners use lifts, they have a much better ability to access the small window areas, and this makes it much easier to clean. If the professionals use a stand attached to a truck, this can reach up to 42m in just a few minutes. The problem with other window cleaning methods is that they may take some time to set up, but this is a quick and easy way to get the job done right first time.
